

369 Showroom Check

Administrator Guide

Set up the rounds, define what good looks like, and act on the results.

About This Guide

This guide is for the person who sets the system up and reads what comes out of it. It covers the schedule, the original photographs, who may record, the results, and the housekeeping.

If you only walk rounds, read the **User Guide** instead - it covers the phone app and nothing else.

You can do almost everything from the phone. A few tasks exist only in the web workspace, and each is marked **web only** where it appears.

***IMPORTANT** The system measures; it does not decide. Every result is shown next to the original so a person can judge it. A low score is evidence to look at, never a verdict on somebody.*

Your Setup at a Glance

- **Set the office timezone first** - the whole schedule hangs off it, and nothing else is right until it is.
- **Create the rounds** - when checking happens, and how long each window stays open.
- **Add an original for each view** - until you do, nothing can be compared and the app asks for nothing.
- **Decide video, photographs, or the cleaner's choice** - and who is allowed to record at all.
- **Leave the thresholds alone for a week** - then move them to fit what you actually see.
- **Watch Compare daily, Missed Rounds weekly** - one is the room, the other is the habit.

PART 1 FIRST-TIME SETUP

Step 1 Sign In and Find the Gear

Sign in exactly as anyone else does, with the server address, database, username and password.

What marks you out as an administrator is on the **Dashboard**: a **gear icon** in the top band, next to the log-out arrow. It appears only for managers. Tapping it opens a sheet titled **Configuration** with three destinations.

What are you looking at?	What it means
Settings	The five setup tabs - rounds, photographs, video, permissions, retention.
Rounds	The schedule on its own, with an editor for each round.
AI review	The optional written review. Off unless you switch it on.
The red Missed chip	Tappable for you, not for anyone else. Opens the missed-rounds list.
History and Compare tabs	Yours only. Ordinary users see just Dashboard and Profile .

Figure 1. The administrator's Dashboard - four tabs, the gear icon, the progress ring and the missed count.

Figure 2. The Configuration sheet, reached from the gear icon.

TIP Anyone with system-administrator rights on the server is automatically a Showroom Check Manager. You do not have to grant the role to yourself.

Step 2 Set the Office Timezone

Open **Settings** and stay on the first tab, **Daily rounds**. Set **Office timezone** to wherever the showroom actually is.

The hint under the field says it plainly: **The whole schedule is anchored to this timezone, not to each user's own**. A round scheduled for 09:00 opens at 09:00 where the room is, whatever time it is on the phone in someone's hand.

This field saves the moment you pick it. There is no Save button on this tab.

What could go wrong?	What happens
The timezone is wrong	Every round opens at the wrong time of day, for everybody. This is

What could go wrong?	What happens
	the most damaging single mistake available to you.
It was guessed at install	The system took its best guess from your users' own timezones. Check it rather than trust it.
Your staff are in another country	It does not matter. The setting follows the room, not the people.

Figure 3. The Daily rounds tab, with the office timezone and the button through to Rounds.

Step 3 Create the Daily Rounds

From **Settings**, tap **Rounds** - or reach the same screen from the gear. Each round appears as a card with its name, period, window and days, and a switch to turn it on or off.

Tap **Add a round** to make a new one. It is pre-filled to start where the last one ended, so it does not clash. Tap any card to open its editor.

What are you setting?	What it does
Name	What the cleaner sees on the Dashboard. Make it recognisable.
Period	Morning, Afternoon, Evening or Night. Groups the round on reports.
Starts at / Ends at	The window. The round can only be captured between these times.
Window length	Worked out for you. Make sure it is long enough for the walk.
Days	Tap each weekday to include it. Sunday is off by default.
Order	Where the round sits in the list.
Instructions	Shown on the dashboard while the round is open.

Figure 4. The Rounds list, with each round's window and days, and Add a round at the foot.

Figure 5. A round open for editing, showing the window, the day chips and the instructions.

IMPORTANT A window cannot cross midnight, and two active rounds cannot overlap on a shared day. A 22:00 to 02:00 night round has to be entered as two separate rounds.

Step 4 Add an Original for Each View

This is the step that decides whether any of this works. Until a view has an original, it cannot be compared, and the app will not even ask for it.

Open **Settings**, then the **Showroom photos** tab. There are four views, fixed. Tap one to open its editor, then **Take photograph** or **Choose from phone**. Fill in **What this shows** and **What to look for**, then save.

What matters most?	Why
Stand where the round is actually walked	Framing matters more than photo quality. An original taken from the doorway will never line up with a round walked from the floor.

What matters most?	Why
Use the same kind of phone the staff use	Held the same way, at the same height.
Shoot in normal working light	Not with the blinds shut, and not at a different time of day than the rounds.
Name it for what it shows	"Bags area" means something to the person holding the phone. "Left" often does not.
Capture the whole view	Not a close-up of one corner.

TIP The best original is one of your own round photographs. Open a round in the web workspace, find the view, and press **Use this as the original** - the framing then matches by construction. Every round measured against the old picture is re-scored automatically.

IMPORTANT There are exactly four views and there is no way to add a fifth. A view you clear stops being asked for, but the row and its name remain.

PART 2 HOW ROUNDS ARE CAPTURED

Step 5 Choose Video, Photographs, or Both

Open **Settings**, then the **Video** tab.

Allow a video round is the master switch. Leave it on and the cleaner chooses, round by round, between one sweep of the room and photographing each view. Turn it off and every round is photographs only.

What are you setting?	What it does
Allow a video round	On, and the cleaner chooses. Off, and it is photographs only.
Clip length and Unit	How long the sweep runs. The single biggest lever on file size.
Quality	Low, Medium or High. Medium is enough for most rooms.
Format	The container the clip is stored in.
Camera	Rear or front. Rear is nearly always right, and it does nothing on a laptop.
Maximum upload	A ceiling per round, protecting the server from one enormous file.

What are you setting?	What it does
Estimated size per clip	Updates as you change the length and quality. Multiply it out before committing.

IMPORTANT Reading a round out of a video needs feature-matching software on the server. It installs itself when the module is installed or upgraded. If that was refused - usually because the server's account cannot write to its own program folder - this tab shows a warning with an **Install it now** button. Until it succeeds, video rounds are stored but never scored, and the cleaner is not offered the choice.

No sound is ever recorded, on any setting. This keeps files small, avoids a second permission prompt, and avoids capturing conversations in the office.

NOTE The cleaner now sees the clip played back before it is sent, under **Check the recording**, with the view names lighting up as playback reaches each one. They can **Record again** before anything reaches you. Expect fewer sweeps that missed a wall - and note that a re-recorded clip replaces the first, so you will not see the discarded one.

Step 6 Decide Who May Record

On the **Who can record** tab, choose between everyone with access and a named list. Use the named list where only certain staff should be capturing rounds even though others can see them.

Upload grace period lives here too. It is how long after a window closes an upload is still accepted, and it covers somebody who finished just as the window shut.

Access level	Can see	Can change
No access	Nothing. The app is invisible to them.	Nothing.
User	Their own rounds only, plus the schedule and the originals.	Nothing at all - they can capture a round, but never edit or delete one.
Manager	Everything, including every person's rounds.	Everything, including deleting rounds.

TIP Set the access level per person in the main Settings area of the web workspace, under Users. A person

also needs to be on the allowed list here if you have chosen a named list - the two work together.

IMPORTANT Choose **Who may record** in the web workspace rather than on the phone. The phone's version of this setting does not currently match what the server expects, and a change made there will be refused.

PART 3 READING WHAT COMES BACK

Step 7 Read the Comparisons

Open the **Compare** tab. Rounds are grouped by day, newest first, each with its verdict and score. Tap a round to see each view: the original on the left, what was captured on the right.

A round's score is the **worst** of its views, never the average. One bad wall is the entire point, and averaging would hide it.

Verdict	What it means	What to do
As expected	The view matches its original.	Nothing.
Worth a look	A little different.	Glance at the two pictures.
Something has changed	Clearly different from the original.	Check the room.
Could not line up	The two pictures could not be matched. The score is about the wrong pixels.	Almost always framing. Retake the original from where the round is walked.
Not compared	No comparison happened - no original, or the sweep never showed the view.	Add the missing original, or ask for the view to be covered.

Figure 6. The Compare tab, with rounds grouped by day and their verdicts.

Figure 7. A comparison in detail - the original beside what was captured, with both numbers.

Similar and **Match** answer different questions and must not be confused. **Similar** is how much of the same thing is in both pictures - an emptied room is still highly similar to its original, because all the same walls are in shot. **Match** is whether anything moved, and only appears once the two pictures were successfully lined up.

***TIP** Two photographs of a room where nothing has moved do not score 100. The light changes and nobody stands in exactly the same place twice. Expect a good match in the seventies or eighties.*

Step 8 Work With a Single Round

Open the **History** tab and tap a round to see it in full: the clip, the photographs, who captured it, when it started and ended, and the measured detail.

Two actions live here that nobody else has. **Compare again** re-scores the round as things stand now - useful after replacing an original or moving a threshold - and tells you which views moved. **Analyse with AI** sends the pictures for a written review, if you have that switched on.

What are you looking at?	What it means
Match (worst view)	The round's headline score - its weakest view.
Average match	The mean across the views. Context, not the verdict.
Worst view	Which view produced the headline score.
Compared at	When the measurement was last run, not when the round was captured.
cut short	The clip ended before its configured length.
Not reviewed	No AI review has been run on this round.

Figure 8. The History tab, grouped by day, with each round's size, format and badges.

Figure 9. A round in detail, with Compare again, Analyse with AI and the measured figures.

IMPORTANT Re-running a comparison scores against the original **as it stands now**, not as it stood then. Where an original has been replaced since, the card says so.

Step 9 Tune the Thresholds

On the **Showroom photos** tab, **Warn below** and **Alert below** decide the bands. They start at 60 and 50.

Leave them alone for the first week. Then look at what real rounds actually score in your room, and move them to fit.

What are you setting?	What it does
Warn below	Below this, a view reads Worth a look .
Alert below	Below this, it reads Something has changed .

What are you setting?	What it does
Require the photographs	Refuses a round that is missing any view that has an original. Off by default.

***TIP** Moving a threshold re-bands your entire history the instant you save, and costs nothing. No score is rewritten - only the lines between the bands move - so you can adjust, look, and adjust again without losing anything.*

Step 10 Turn On AI Review (Optional)

From the gear, open **AI review**. It is off until you switch it on, and it never runs by itself - somebody has to press **Analyse with AI** on a round.

The AI describes what changed in words, which is the one thing no measurement can produce. Its own score wanders between runs, which is exactly why the verdict is based on the measured comparison instead.

What are you setting?	What it does
Provider	Where the model runs.
Base URL and API key	How to reach it. The key is visible only to a system administrator.
Model	Which model to ask.
Frames per recording	How many stills to send. Between one and ten.
Timeout and Maximum reply length	How long to wait, and how much to accept back.
What to check	Your own checklist - floor is clean, bins emptied, and so on.

WHAT TO CHECK

Floor is clean

Name
Floor is clean

Figure 10. The AI review screen, with the provider, the model and the checklist.

IMPORTANT A hosted provider means photographs of your premises, and the people in them, leave your building. Confirm you are permitted to send them before switching it on. A model running on your own network keeps everything in-house.

PART 4 KEEPING IT HEALTHY

Step 11 Storage and Retention

On the **Keeping recordings** tab, set how long rounds are kept and what happens when they expire. Video is by far the largest thing this system stores. A daily round across several slots adds up quickly.

Lever	Effect
Clip length	Directly proportional to size. The quickest win.
Quality	Medium is enough for most rooms.

Lever	Effect
Keep for	How long before old rounds are cleaned up. Zero keeps everything forever.
Then: Delete the video only	Keeps the record, the photographs and the scores; reclaims most of the disk.
Then: Delete the whole record	Removes it entirely - and that day then shows as a missed round.

IMPORTANT Automatic clean-up is not running on this version. Whatever you set here, old recordings will not be removed on their own - plan to review disk use by hand until that is fixed. Deleting a round by hand works exactly as described.

Step 12 Publish These Guides Into the App

Staff read documents from **Profile** then **Help** inside the app. You publish them from the web workspace, under **Help**.

Upload a PDF, give it a title, and set two things: where it appears, and who may see it. A document marked for managers is genuinely hidden from ordinary users - that is enforced when the file is fetched, not merely hidden from the list.

What are you setting?	What it does
Section	Which shelf it sits on. Choose the mobile-app shelf for documents staff should read on the phone.
Shown to	Users or Managers . Publish the User Guide to users and this one to managers.
PDF	The file itself. It must genuinely be a PDF.

Figure 11. The administrator's Profile tab, showing the access badge and the Help button.

TIP Documents filed on the user-manual shelf do not currently appear in the phone app. Use the mobile-app shelf for anything staff need to read on their phone.

Step 13 Watch the Missed Rounds

The red chip on the Dashboard counts rounds that closed with nothing captured. Tap it for the list, by date and slot.

Read it for patterns rather than for individuals. A slot that is always missed usually means the window is at the wrong time of day, not that somebody is avoiding it.

What could go wrong?	What it usually means
One slot missed every day	The window does not suit the shift. Move it.
Missed only on certain weekdays	The round is scheduled on a day nobody is in. Untick that day.

What could go wrong?	What it usually means
A round missed right after you deleted it	Deleting a recording re-opens that day, so it reads as missed until it is captured again.
Everything missed since a certain date	Check the office timezone, and that the staff still have the role.

QUICK REFERENCE

If you want to...	Do this
Reach the setup screens	Dashboard → the gear icon → Configuration
Fix the schedule's clock	Settings → Daily rounds → Office timezone
Add or edit a round	Gear → Rounds → Add a round , or tap an existing card
Set what a view should look like	Settings → Showroom photos → tap a view
Make an existing round photo the original	Web workspace → open the round → Use this as the original
Stop video rounds entirely	Settings → Video → Allow a video round off
Restrict who may capture	Who can record → a named list (set this in the web workspace)
Re-score a round	Open it in History → Compare again
Read a round out of its clip	Web workspace → open the round → Read views from recording
Move the warning lines	Settings → Showroom photos → Warn below / Alert below
See what was never captured	The red Missed chip on the Dashboard
Publish a guide to the app	Web workspace → Help → the mobile-app shelf

Things to Remember

- The office timezone is the first thing to set and the most damaging to get wrong.
- Nothing is compared until a view has an original. This is the step people skip.
- Framing beats photo quality. **Could not line up** is nearly always an original taken from the wrong spot.
- A round's score is its worst view, not its average.
- Moving a threshold re-bands the whole history instantly, and rewrites no score.
- Exactly four views exist, and no fifth can be added.

- A window cannot cross midnight, and two rounds cannot overlap on a shared day.
- One recording per round per day. To let it be captured again, you must delete the existing one.
- Deleting a round entirely makes that day read as missed afterwards.
- Video rounds need the feature-matching software installed on the server, or they score nothing.
- A hosted AI provider sends pictures of your premises outside your building.
- Automatic clean-up is not running on this version - watch disk use yourself.
- Set **Who may record** from the web workspace, not the phone.
- Staff get no reminders. They must open the app to learn a round is open.

Set the clock, set the originals, then read Compare daily and Missed Rounds weekly.

--- End of Guide ---
